

# Is a Hot Dog a Sandwich?

Project 0 DS 4002

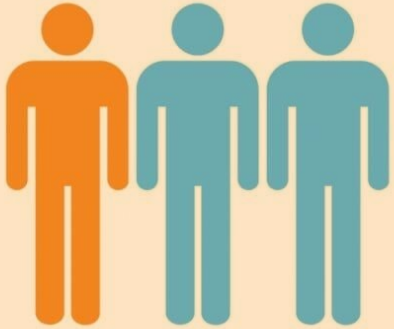

# Motivation

**A group of students curious about how other UVA full-time undergraduate students classify hotdogs.**

**Additionally, this topic has been heavily debated within our group and the overall class, and we wanted to find the majority opinion.**

# Hypothesis

*One fourth of UVA undergraduate students believe that a hot dog is a sandwich.*

?

=

# Data

Entries: 79

Cleaned entries: 76

Relevant Questions:

- *Timestamp*
- *Are you a full-time undergraduate UVA student?*
- *What year are you?*
- *Do you believe a hotdog is a sandwich?*

# Analysis Plan

## Cleaning the Data

- Filtered the data for undergraduate students (i.e. removed students who said they weren't full time but indicated a year)
- Removed null values

## Data Analysis

- Use Chi-squared test to determine significance of results

## Data Visualization

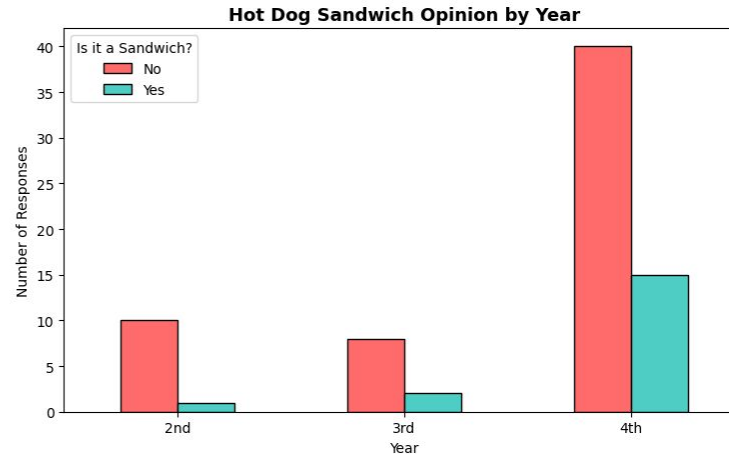

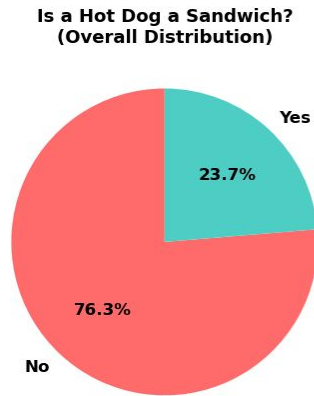

- Presented data in a pie chart and histogram

# Results

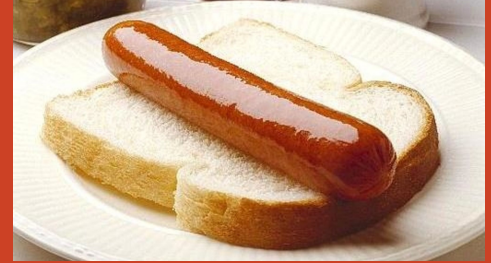

Chi-squared test of year and response to is a hotdog a sandwich yields  $p \approx 0.4142$

- Determined to be statistically insignificant, there is no significant correlation between class year and hot dog categorization response

# Next Steps

- Get a more representative and larger sample
- Eliminate bias by randomizing the sample (rather than using voluntary sampling)
- Come up with more questions to collect more data points
- Create predictive models (e.g. can we predict if a certain undergraduate year is more inclined to think that a hot dog is a sandwich?)

# Acknowledgements

- Data was collected from University of Virginia students
- Analysis performed by DS4002 Spring 2026
