

Is a Hotdog a Sandwich?

By Rachel Kang and Morgan Simmons

Motivation

Both of us believe that hotdogs are indeed sandwiches. We hope that our analysis shows that over 50% of UVA students have the correct opinion that a hotdog is a sandwich.

Hypothesis

More than 50% of Full Time Undergraduate
Students at UVA believe that a Hot Dog Is a
Sandwich

Data

Number of responses: 79

Number of undergraduates surveyed: 76

Number of undergraduates who said 'Yes': 56

Number of undergraduates who said 'No': 18

Analysis Plan

Our analysis methods for the cleaned data were to begin with exploratory charts in which we could visualize the total number of Yes and No answers to whether somebody considered a hot dog a sandwich. Continuing our analysis, we wanted to consider if different class years had the same proportionality of Yes/No answers as the total number of respondents. We were able to use exploratory charts such as a histogram.

Results/findings

To evaluate the success of our analyses, we would look for a clear correlation (positive or negative) in our plots. If the plots have no correlation, we will not be able to draw a conclusion from the results. This exploratory analysis was successful because we were able to determine that UVA students respond similarly to this question regardless of their year. Additionally, we were able to discover that more than 50% of UVA full time undergraduate students did not believe that a hot dog was sandwich. Below are graphs that display the total number of responses across years at UVA. There were no first year respondents and many of the responses were swayed in the direction of third and fourth years due to a high participant rate.

Next steps

Get more data to compare with other schools

Get more people to join the correct opinion

Include non-undergraduate UVA in our data
